```
public class Box<T> {
    public T content;

//Box의 내용물이 같은지 비교
    public boolean compare(Box<T> other) {
        boolean result = content.equals(other.content);
        return result;
    }
}
```

```
public class GenericExample {
 public static void main(String[] args) {
   Box box1 = new Box();
   box1.content = "100";
   Box box2 = new Box();
   box2_content = "100";
    Box box3 = new Box();
   box3.content = 100;
   boolean result1 = box1.compare(box2);
    System.out.println("result1: " + result1);
   boolean result2 = box1.compare(box3);
   System.out.println("result2: " + result2);
```

실행 결과

result1: true result2: false
